

Leveraging Emission Detection for Decarbonization

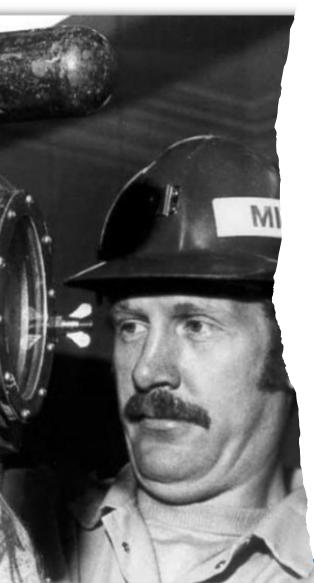

Ridha BELLAMINE COP 28 – Dubai, 3rd of December 2023

INDUSTRIAL SCIENTIFIC CORPORATION

One of Fortive Corporation's 20+ operating companies since 2017 (FTV)
- \$7B in annual revenue
Global headquarters in Pittsburgh, Pennsylvania, United States
Manufacturing in Pittsburgh (US) and Shanghai (China)
1,200+ global employees

The Evolution of Gas Detection - Canaries

- Canaries were commonly used in coal mines to detect dangerous levels of carbon monoxide and methane gas
- Canaries are more sensitive to these gases than humans and would show symptoms of distress before the gas levels became dangerous for humans
- Miners would keep a canary in a cage and if the bird died or became sick, they knew to evacuate the mine immediately
- The phrase "canary in a coal mine" originates from this practice, meaning an early warning of potential danger

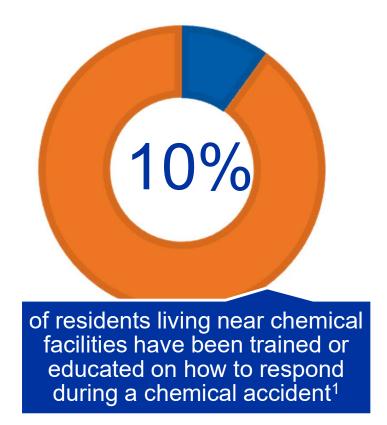

INDUSTRIAL SCIENTIFIC

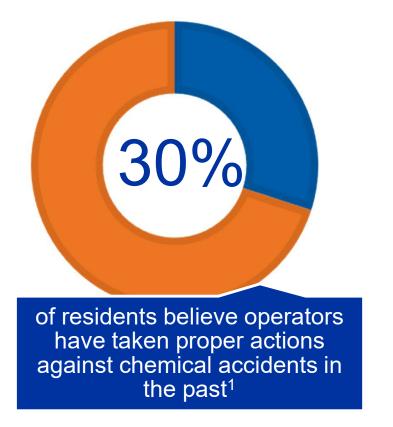

INDUSTRIAL The Evolution of Gas SCIENTIFIC Detection – Flame Lamp

- The next type of gas detection used in mines was the flame light
- The Davy lamp is a safety lamp for use in flammable atmospheres, invented in 1815 by Sir Humphry Davy
- One benefit of using a flame light was that it provided light, enabling miners to see in the mine
- The flame was encapsulated in a flame-arrestor shell, so it couldn't ignite the outside atmosphere
- A glass piece on the outside of the flame light had three incisions running horizontally along it
- Miners started the flame in the middle line while in a fresh air environment
- If the flame dropped to the bottom line, it indicated an oxygen-deficient environment
- If the flame rose to the top line, it indicated the presence of methane or an oxygen-enriched environment

Your Community Counts on You

1- Han DH, Park MS. Survey of awareness about hazardous chemicals of residents living near chemical plants in South Korea. Ind Health. 2018;56(4):285–291. doi:10.2486/indhealth.2017-0119

Your HazMat toolkit is essential to keeping trust in your community and with local responders

SAFER compliments any industrial ESG program

Environment, Social, Governance

Leading Gas & Emission Detection Leading Connected Safety and Dynamic Plume Modeling

Carbon-Based Gas Detection Systems and The **SAFER One Solution** emerges as a powerful tool

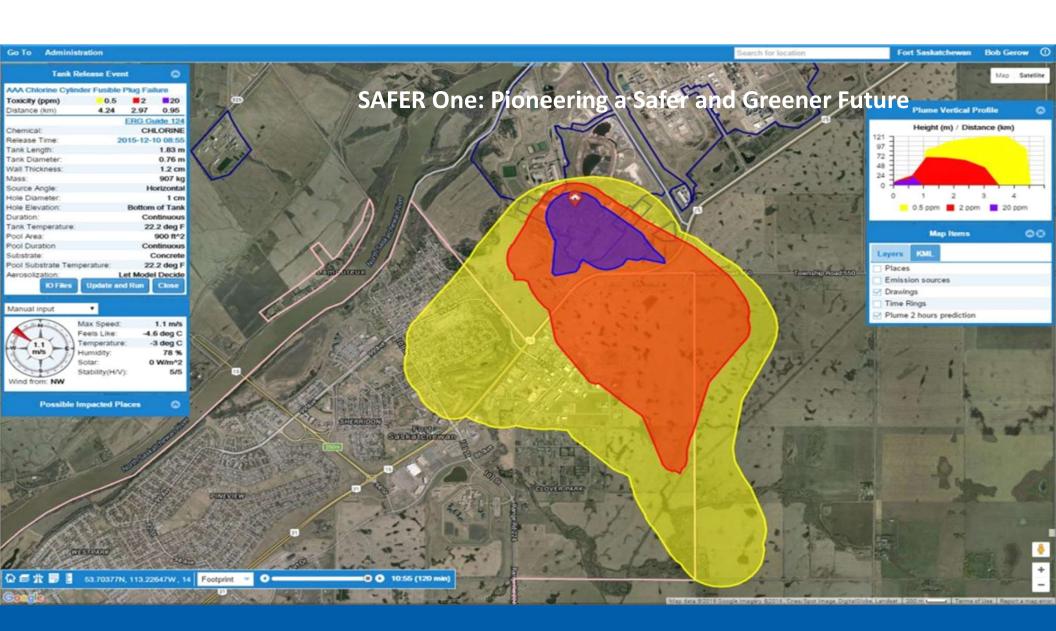

INDUSTRIAL

Gas and Emission Detection: A Catalyst for Change

Emission detection technologies are pivotal in aligning

industrial activities with **environmental** responsibility.

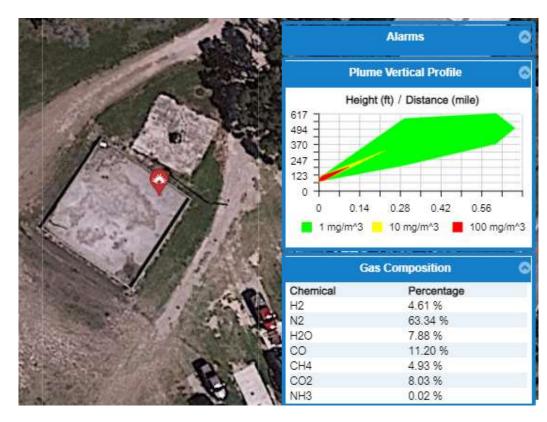

Dynamic Modeling

Dynamic plume models allow you to:

- Quickly calculate chemical release rates and pinpoint the leak source
- Establish control by understanding how current conditions are affecting response teams and areas of concern
- Automatically update with real-time data from on-site gas and weather sensors
- Model multiple scenarios (Flare, Stack / Jet, Pipe, etc.)

See your emergency in real-time

- Systematic Approach For Emergency Readiness
- 40+ years of business history
- SAFER One Cloud Based (AWS) platform
 - Developed in conjunction with major players in the chemical / refinery industry
 - World recognized chemical scientists and engineers on staff today
- 2,500 + users, in 20+ countries

SAFER History

Implementing the Vision

Implementing emission detection with SAFER One requires a coordinated effort across sensor deployment, data aggregation, and strategic analysis.

With **Industrial Scientific's expertise**, this journey becomes not only manageable but transformative.

iNet Now

iNet Now Live Monitoring

Live monitoring software that provides worker location and status in real time and sends text or email alerts when incidents occur.

Live monitoring now includes Heat Maps for quick and easy, visual representation of real-time alarms.

Real-time safety alerts from anywhere improve response times and outcomes.

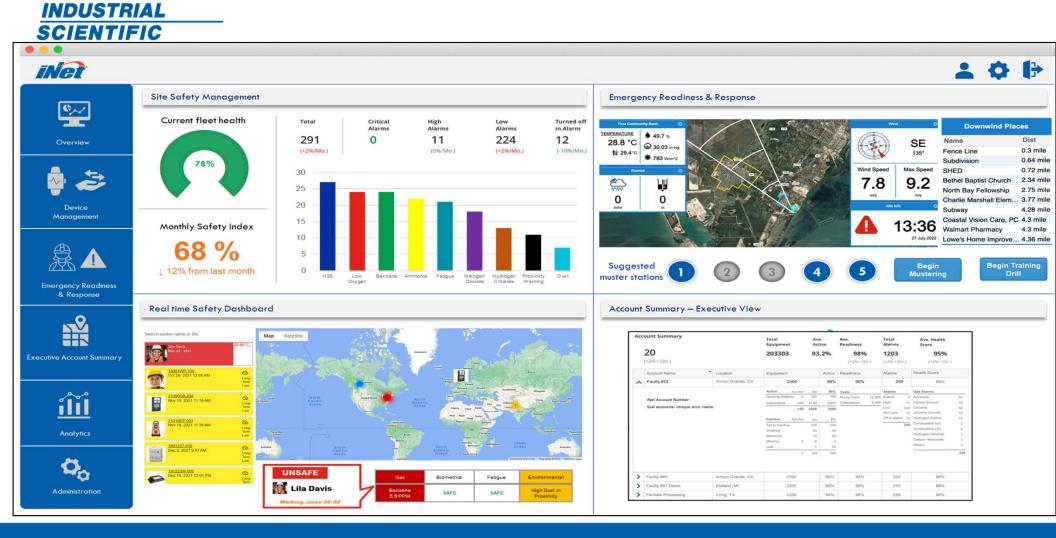

SAFER One™ Dynamic Plume Modeling

Dynamic plume modeling software that alerts you of a chemical release and tell you where it is coming from, where it will be going, and who it will impact.

SAFER One, integrates with iNet Now, includes Heat Maps for quick and easy, visual representation of real-time alarms.

Real-time safety alerts from anywhere improve response times and outcomes.

Protect your people, plant and community with SAFER One[™].

SAFER One allows you to:

- ✓ Quickly identify leak source and severity
- Predict the path and concentration of the hazard in real-time
- ✓ Know when to evacuate civilians
- ✓ Operate with confidence
- Run true-to-life drills and ensure procedures are optimized
- ✓ Store key emergency response information in a single, web-based platform

Safer One is compatible/integrates with several 3rd parties including the competition

Thank You

Industrial Scientific. Since 1985.
